

Card Creation and API fetching in AEM

By Priyanka Ravi

1. Applying Styling to Header & Footer:

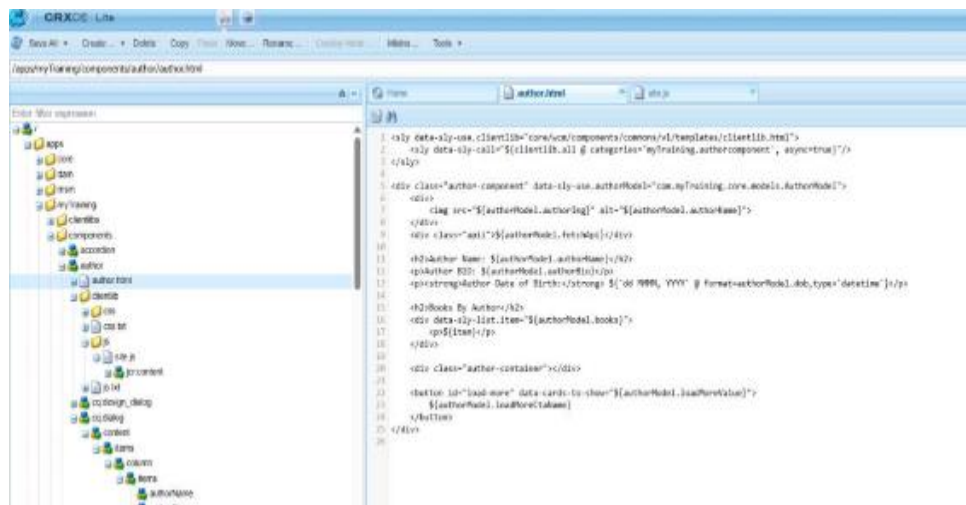

Customize the appearance of the header and footer by leveraging the AEM Style System and modifying the CSS styles within the ui.frontend module.

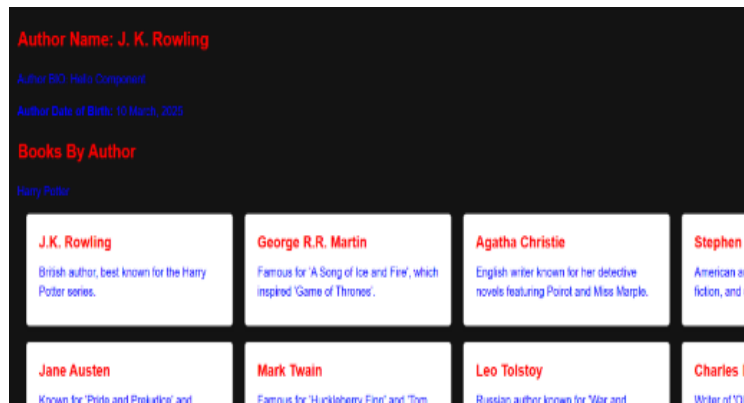

2. Adding a Custom Page Property:

Introduced a new textarea field called addScript in the Book Page component. This feature enables content authors to embed scripts dynamically.

3. Enhancements to the Author Component:

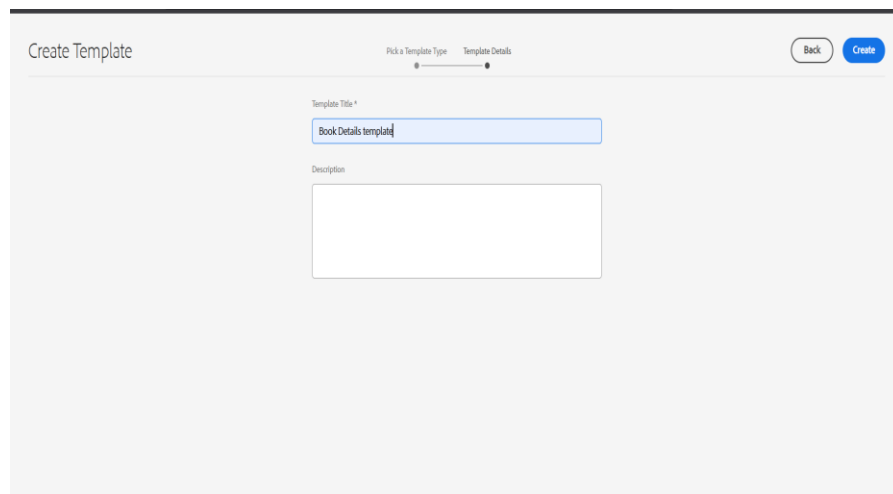

- Incorporated a new text field along with a multifield to manage multiple books.
- Implemented a Sling model to retrieve and handle these attributes.

4. Developing the ‘Book Details’ Template:

- Created a specialized template based on the base page framework to streamline the creation of book-related pages.
- The book component template now includes author-related information.

5. Building the Book Page Component:

- Designed a Book Page component utilizing the base page structure.
- This component retrieves stored properties and allows authors to insert dynamic content.
- Configured Author Model to support multifield inputs for improved user interaction.
